Status data assimilation in Austria

Florian Meier, Florian Weidle, Xinsheng Xu, Christoph Wittmann, Clemens Wastl,
Nauman Awan, Josef Kemetmüller, Phillip Scheffknecht, Stefan Schneider

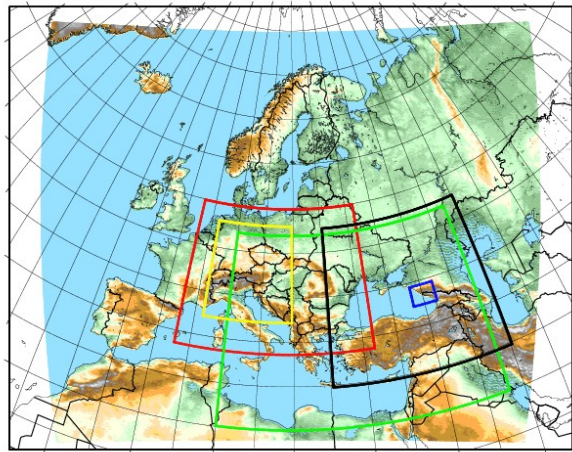

Operational configurations

- ▶ **ALARO 4.8km L60** cy36t1 IFS-coupling+INIT+CANARI-SOIL 4x/day+72h
- ▶ **AROME 2.5km L90** cy40t1 hourly-IFS-coupling+3D-VAR+CANARI-OIMAIN-inline+SNOW exchange 8x/day
- ▶ **ALADIN-LAEF 11km** 16 member IFS-EPS coupling BREEDING-BLENDING+CANARI perturbed (at ECMWF with LACE partners)

Test configurations:

- AROME-EPS 2.5kmL60 cy40t1
mostly downscaling PHD Endi Keresturi: tests with EDA+Jk
- AROME-RUC 2.5/1.2km L90 cy40t1
hourly 3D-Var downscaling of AROME-soil radar assimilation, LHN, IAU, MODE-S

LAEF

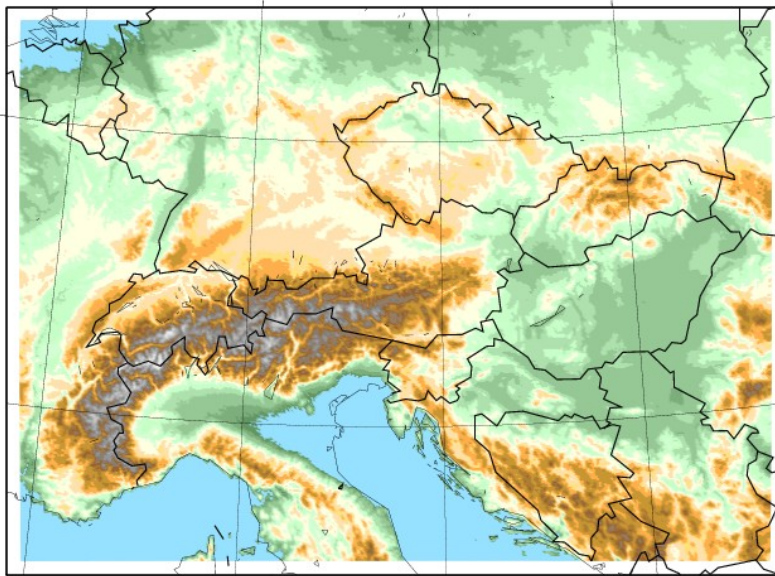

ALADIN-AUSTRIA 5km Domain & Topography

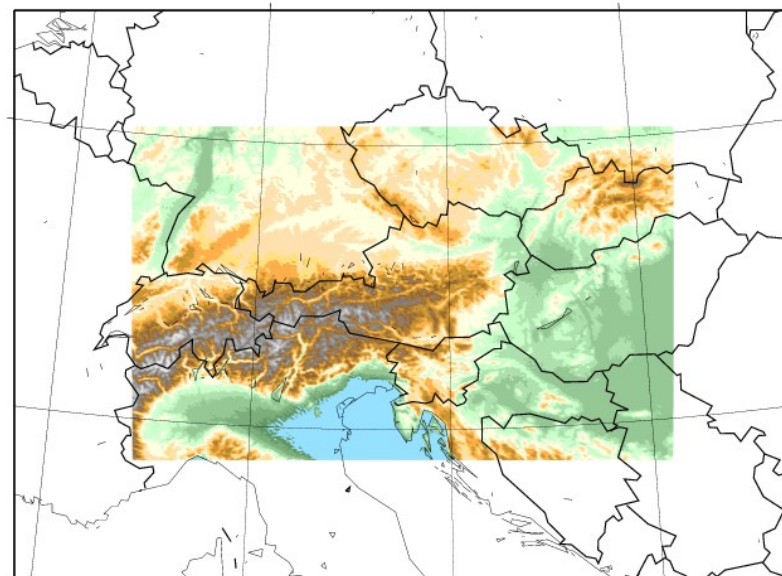

A

ALARO4.8km

AROME 2.5km DET + EPS

AROME-RUC 1.2km/2.5km

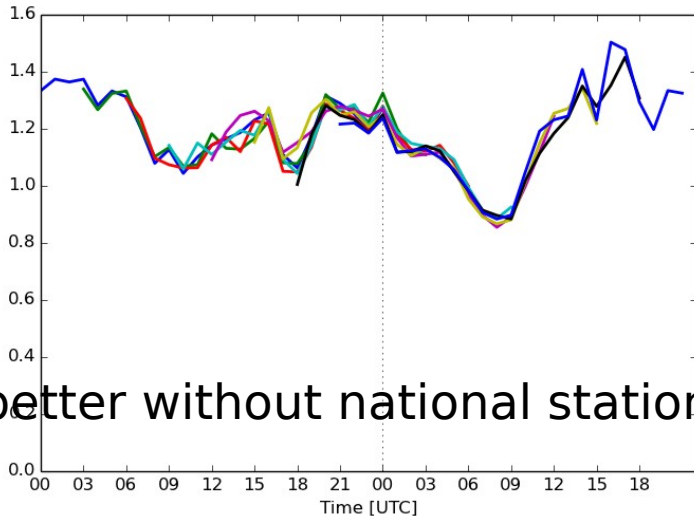

Operational news

- ▶ New super computer expected in autumn 2017
- ▶ AROME-E-SUITE with 3D-VAR cy40t1 should become operational then - right now still cy36t1

Modification of surface

Bad performance of 12 and 15 UTC run in the first forecast hours

10m_wind: Mean RMSE from: 20160909 to 20160909

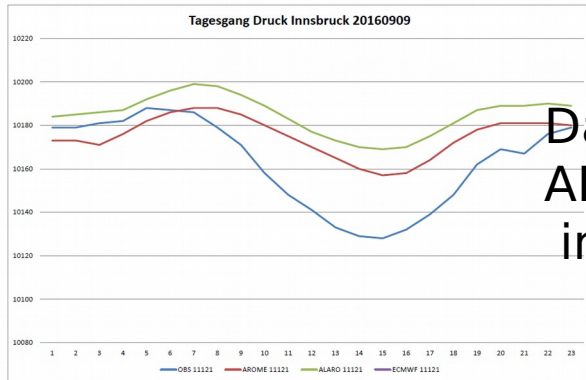

better without national stations

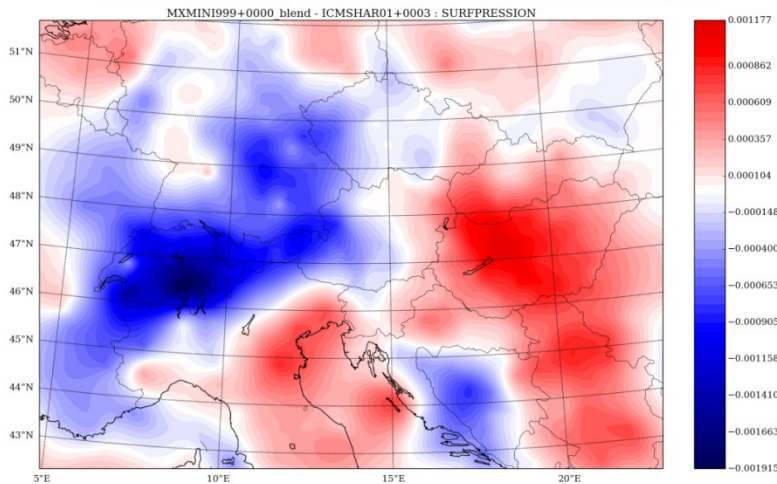

— OPLACE 00 — OPLACE 06 — OPLACE 12 — OPLACE 18
 — OPLACE 03 — OPLACE 09 — OPLACE 15 — OPLACE 21

Cloud nudging – code modifications

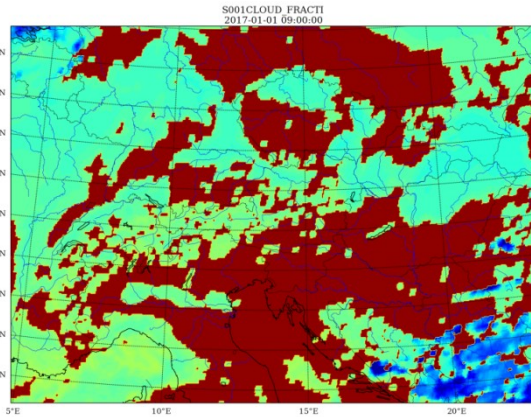

OBS-> GETCLOUDINFO PREPROC-> OBS on GRID in FA-FILE->001

- Start from: Pre-processor „getcloudinfo“ trunk r14912 40h1, main routine: branch 38h1.2, adapted to cy40t1 export
- Several timeslots: ->run pre-processor once per slot save observations to different vertical level in FA file: S001->S003, modify also: mf_phys.F90
- satellite projection adapted to Austrian data, surface data: BUFR->ASCII
- Enable reading of NETCDF NWCSAF
 - ▶ data (until now HDF5)
- add optional critical humidity profiles
 - ▶ from ALARO/Haiden 2004
- Take orography into account for surface station interpolation
- take optional saturation equation from
 - ▶ Goff-Gratch to get qsat (water and ice)
- Random perturbation generator for obs
- Use spread for cloud base estimation

Cloud nudging 1st January 2017 09UTC+3h

SCADA windturbine assimilation

- ▶ wind speed, temperature and gondola position/wind direction at hub height
- Treat an AROME like one layer wind profile enable to separate for
obstype 6 $(\sigma_o = 1.41 K; 1.89 \frac{m}{s})$
- put data to obsoul format
- Reject data, if turbine is not in working mode \rightarrow wrong wind direction
- speed is corrected for perturbation of flow by turbine SCADA software
- problem: airflow is also disturbed by neighbored wind turbines
 ▶ \rightarrow the model „does not know“ it \rightarrow bias

possible solutions:

Take only highest/single standing turbine data - data loss
 wind direction specific blacklisting
 bias correction from longer timeseries - variability?
 parameterise windfarm in model (Fitch et al. 2012, WRF)
 to reduce effect in the first guess

▶ **Supervisory Control and Data Acquisition**

Experiments with GPS-RO project AROSA

- ▶ Operator available in AROME (Healy et al.)
- ▶ working with BUFR-files from ROM-SAF and private company Spire Inc.

Questions:

low model top problematic,
blacklisting,
thinning
enough observations
Could operator be adapted?

$$\alpha(a) = -2a \int_a^{\infty} \frac{d(\ln n)/|dx|}{(x^2 - a^2)^{1/2}} dx,$$

llignore_tpd=.TRUE.

Plans for the near future

- ▶ Migration to new HPC
- ▶ Running test periods with AROME-RUC 1.2km
- ▶ Tests with Austrian MODE-S, SODAR, latent heat nudging (project VIEsion)
- ▶ Some more tests with cloudmasking + SCADA + EDA (project ICE-CONTROL)
- ▶ Tests of GPS-RO assimilation in AROME (project AROSA)
- ▶ Update of B-Matrix EDA based?
- ▶ Wind-nudging
- ▶ Further tests on RADAR assimilation
- ▶ EKF-activities Stefans' talk
